- All ranging poles are MADE IN GERMANY
- Sturdy steel tip

All special features at a glance

- Use of best wood (Ø 28 mm) in production
- Round tip for working on grass, forest floor, sand.

Description

Ranging poles are used to mark and signal terrain or boundary points during construction and surveying work. In addition, ranging poles help to align or align in the straight line between two poles with a third ranging pole. The two-colour paint makes the alignment rods easily recognisable even from a distance. The colour fields are 50 cm long. Depending on the upper colouring, a distinction is made between white and red heads. In order to make it easier to align, ranging poles are often placed in rows with alternating heads. Sturdy steel tips are used for robust work on hard ground. Only the best wood (Ø 28 mm) is used for this ranging pole. NESTLE wooden ranging poles are PVC-coated for a long service life. All Nestle alignment rods are Made in Germany.
